

Personal Health Dashboard

Team 7: Adrien Rozario, Vonn Sayasa, Grace Yu, Tamiya Phillips

Final Demo

Table of Contents

1. Problem Overview

- Problem
- Solution
- Architecture
- Challenges

2. Infrastructure Walkthrough

- Azure Portal
- Compute
- Database
- Object Storage
- Environment Variables
- Github Repository

3. Live Demo

- User login
- Using the app
- Storing data
- Functionality

Problem

01

Lack of centralized health tracking

02

Expensive wearable health tracking devices

03

Minimal progress visualization

04

Limited pattern awareness

Solution

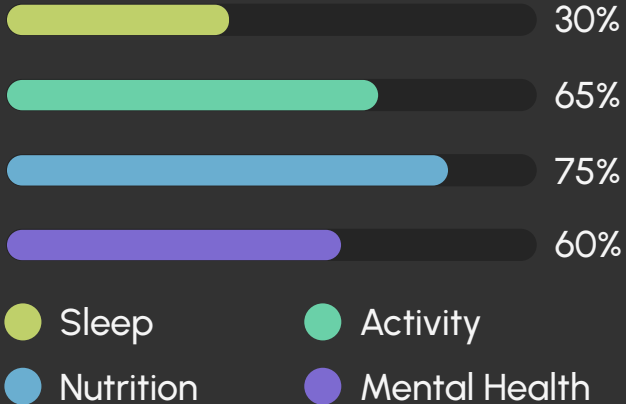

Log Metrics

Visualize Trends

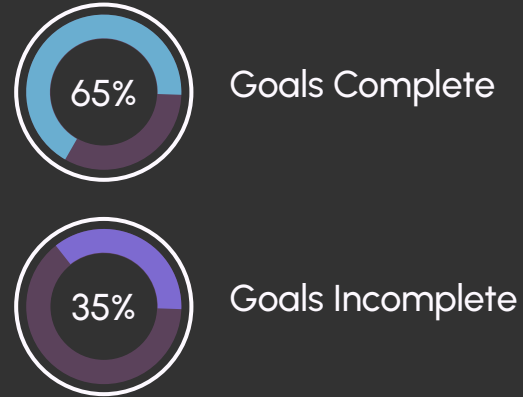

Track Goals

Store Files

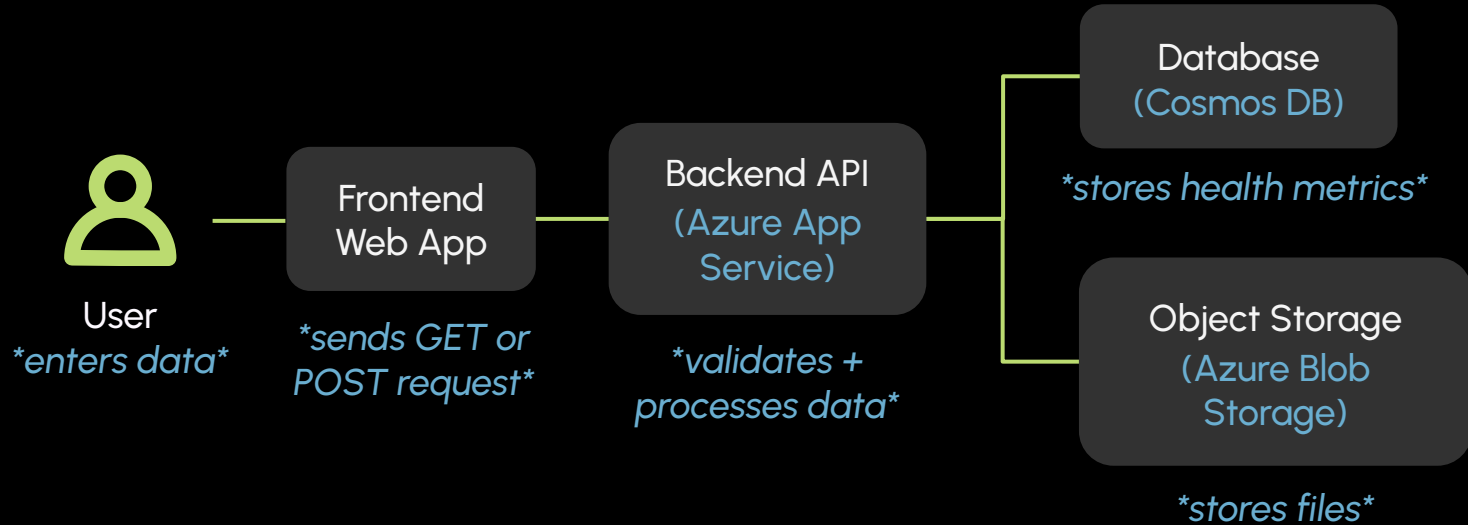

Centralized Dashboard

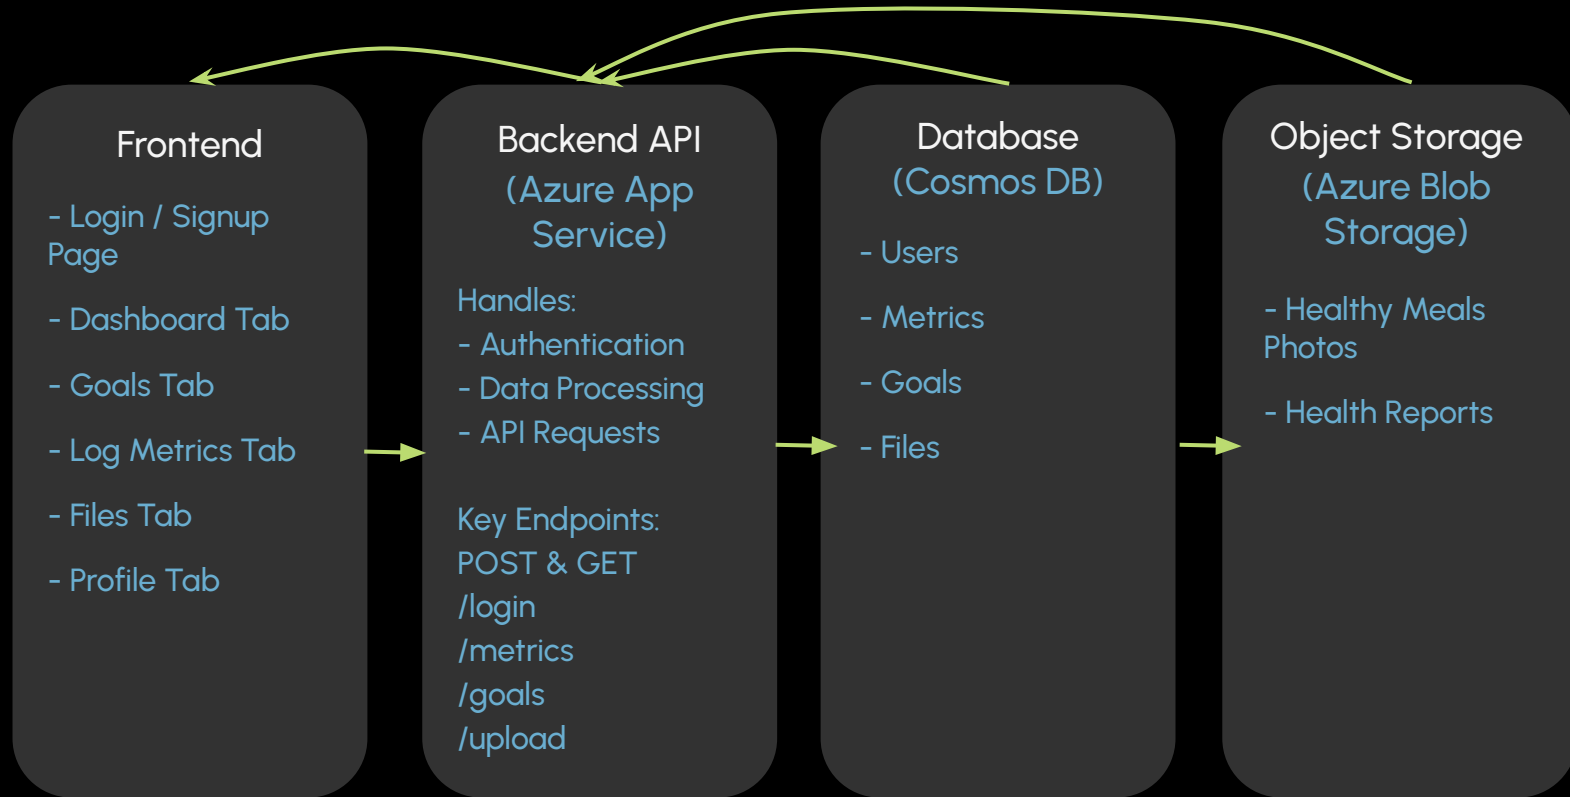

Progress Tracking

Final Architecture Diagram

Data Flow

Challenges

1. Database Mix-up

- Began using SQL instead of NoSQL
 - Took time to switch to NoSQL
- Firebase Auth too complex
 - Took time to switch to Supabase

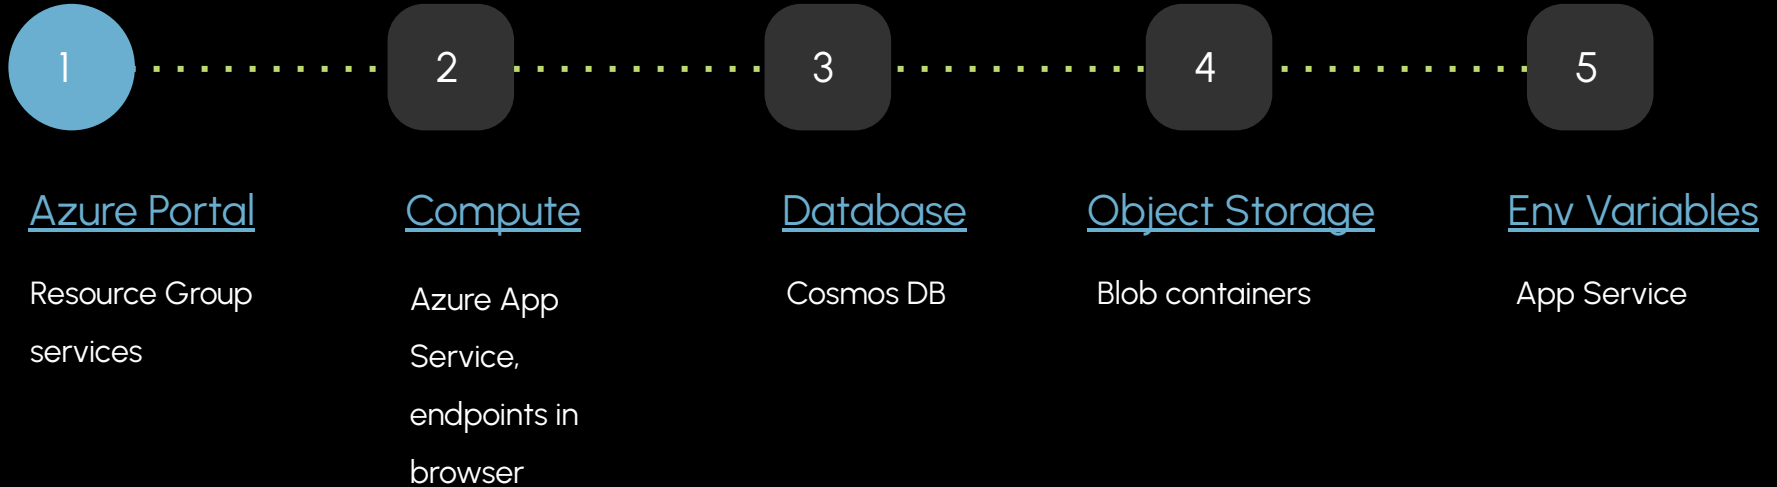

2. Functionality Debug

- Backend didn't update
 - Multiple servers were running
- Merge conflicts in UI branches
 - Created separate page
- Trouble hosting app in Azure
 - Revisited backend + cloud setup

3. Limited Metrics

- Only had time to integrate basic metrics & simple visualizations
- No notifications / reminders feature like most Health Apps have

Infrastructure
